CIRCUIT DESCRIPTION

Noise detector and electric field strength detector circuits

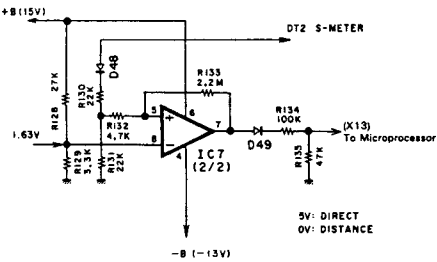

1. Noise detector

This circuit detects the presence/absence of interference from adjacent stations, etc., and applies the microprocessor with the Noise present (5V) or absent (0V) signal. The detection output is extracted from AF OUT of IC5 (LA1231N) in the daughter (2), and only the noise component is amplified by 120kHz (center frequency) tuning amp IC6 (BA401). The output is regulated by D50 and D51, and the comparator in IC7 outputs "H" = 14V ("L": -12V) when the noise DC voltage attains about 1.4V. This output is 5V/0V converted by D52, R127 and R128, and applied to the microprocessor port.

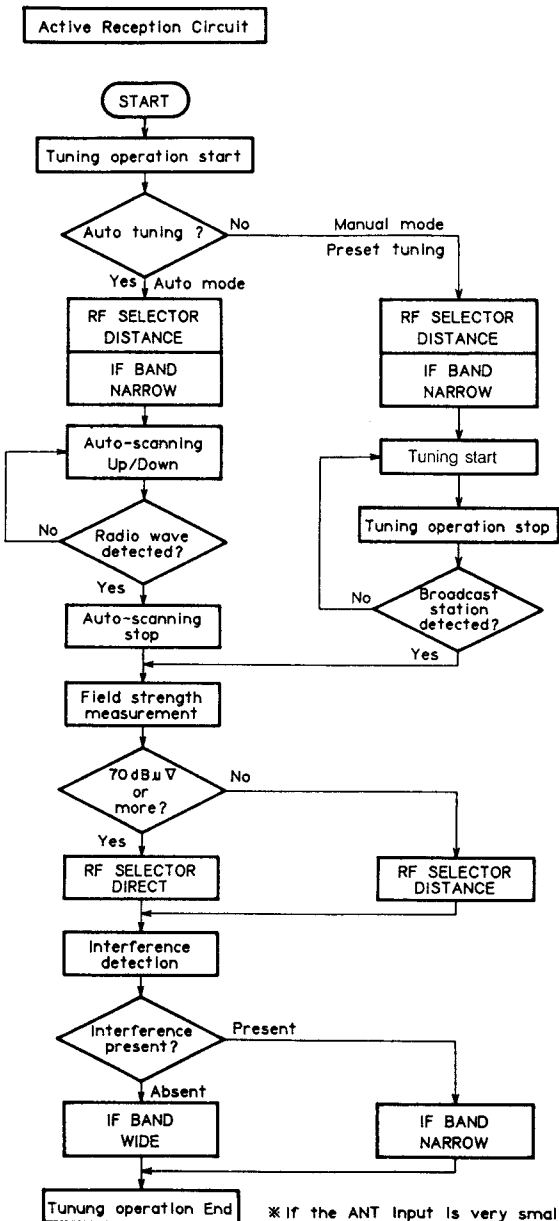

2. Field strength detector

The S meter voltage from IC5 (LA1231N) in DT2 is detected and, when the field strength exceeds 70 dB with respect to the ANT input voltage, the IC7 output goes "H" = 14V. This is 5V/0V converter and supplied to the microprocessor.

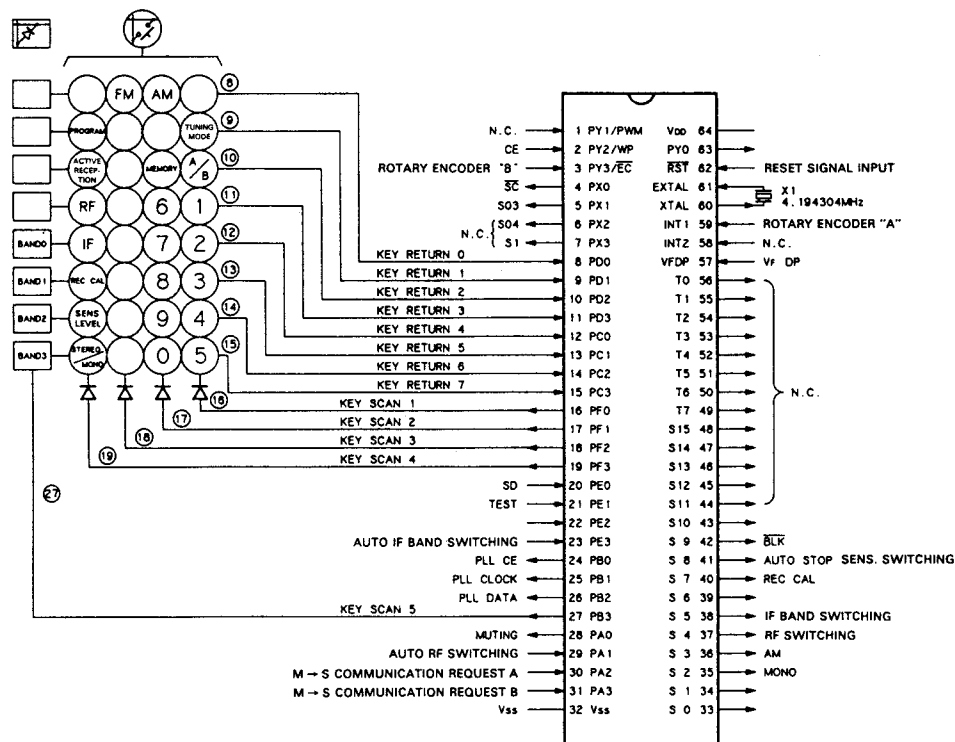

CIRCUIT DESCRIPTION

※ If the ANT Input is very small (less than 10dBµF) the Forced Narrow mode is activated regardless of the presence or absence of interference.

Preset channel memory

- When the MEMORY key is held depressed for more than 0.2 second then the key is released, preset channel display "—" blinks for about 5 seconds. In this period, select A/B and press a numeric key (1 to 0); the preset channel memory is stored and the stored channel is displayed.
- When the MEMORY key is pressed again while "—" is blinking, the display remains the same, but the unit gets ready for another preset channel memory for another 5 seconds. If nothing is done after the key has been pressed, the preset channel memory becomes impossible in about 5 seconds; the preset channel display returns to the last channel display, and the MEMORY indicator goes off.
- When an operation which is accompanied by muting is activated while "—" is blinking, the preset channel memory mode is canceled immediately. This occurs when one of the RF, IF, AUTO TUNING SYSTEM, REC CAL, FM and AM keys is pressed or when the rotary encoder is rotated. However, if the blinking of "—" was started during the AUTO TUNING SYSTEM operation, the preset channel memory mode is not canceled even when the AUTO TUNING SYSTEM key is pressed.
- The MEMORY key is not accepted while the muting timer is activated.
- The MEMORY indicator lights while the key is pressed. When the key is held depressed for more than 0.2 second, the indicator continues to light even after the key has been released and, at this time, "—" on the preset channel display starts blinking.

Programming feature

- Last Ch → Last Ch band
A: Ch0 of A → Ch0 of B
B: Ch0 of B → Ch0 of A

REC CAL

- During REC CAL operation, keys other than the REC CAL key are not accepted.
- The REC CAL operation is canceled by turning power OFF (when the microprocessor is reset).
- The preset channel memory mode is canceled when the REC CAL key is pressed.
- When the REC CAL key is pressed during frequency scanning in the Auto Tuning mode, the frequency scanning pauses temporarily. The frequency scanning resumes when the REC CAL mode is canceled by pressing the REC CAL key again.
- When the REC CAL key is pressed during the AUTO TUNING SYSTEM operation, the AUTO TUNING SYSTEM operation will be carried out until the end.

CIRCUIT DESCRIPTION

Auto tuning system (ATS)

- The ATS operation mode can be turned ON/OFF only during FM band reception.
- When the RF or IF key is pressed during FM band reception, the ATS mode is canceled immediately. If the ATS operation has been activated, it is also aborted at this time.
- As the final ATS operation mode is stored in memory, the ATS operation is started if the final mode was the ATS mode when the microprocessor is reset, power is turned ON, or when any of the FM band key, numeric keys or A/B key is pressed during receiving a band other than FM.
- When the rotary encoder is rotated in the ATS mode or when the ATS key is pressed during tuning (frequency scanning) operation, RF is set to the Distance and IF to Narrow.
- However, if SD (microprocessor pin 20) "H" is not detected as the result of frequency scanning, the RF and IF mode will not change even after the end of frequency scanning.
- Even when the reception status changes after the ATS operation has ended, the ATS operation will not resume.

Test Frequencies that are stored in memory channels in test mode

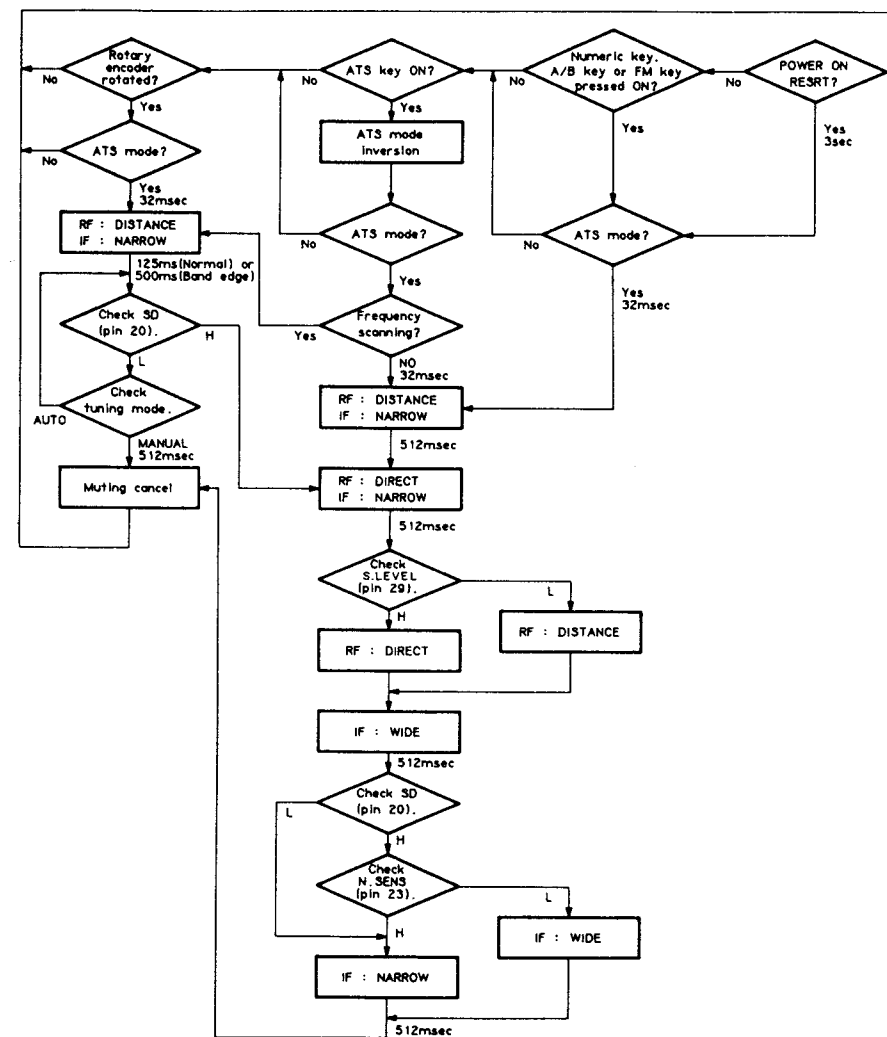

- Band preset scanning is possible only in Test mode.

CIRCUIT DESCRIPTION

IC18: MC1495L (X05-342)
MPX SUB demodulator

The Direct Pure MPX enables stereo decoding without causing beat interference, in theory, by linear-multiplying two analog signals (stereo composite signal and 38 kHz sine wave sub carrier signal).

This unit provides the linear multiplier with high S/N ratio, which is designed with the new theory, so that the high signal-to-noise ratio of 94 dB for the MPX unit itself and the resistance to overmodulation of 400% (dynamic range: 106 dB) are realized while the conventional characteristics are maintained.

CAUTION: For continued safety, replace safety critical components only with manufacturer's recommended parts (refer to parts list). Indicates safety critical components. To reduce the risk of electric shock, leakage-current or resistance measurements shall be carried out (exposed parts are acceptably insulated from the supply circuit) before the appliance is returned to the customer.

DC voltages are as measured with a high-impedance voltmeter during reception of the FM broadcast signal (with a signal strength of 60 dB at the ANT terminal). Values may vary slightly due to variations between individual instruments or/and units. Values in parentheses are as measured during reception of the AM broadcast signal (with a signal strength of 60 dB at the ANT terminal).

Les tensions c.c. doivent être mesurées avec un voltmètre à haute impédance pendant la réception d'un

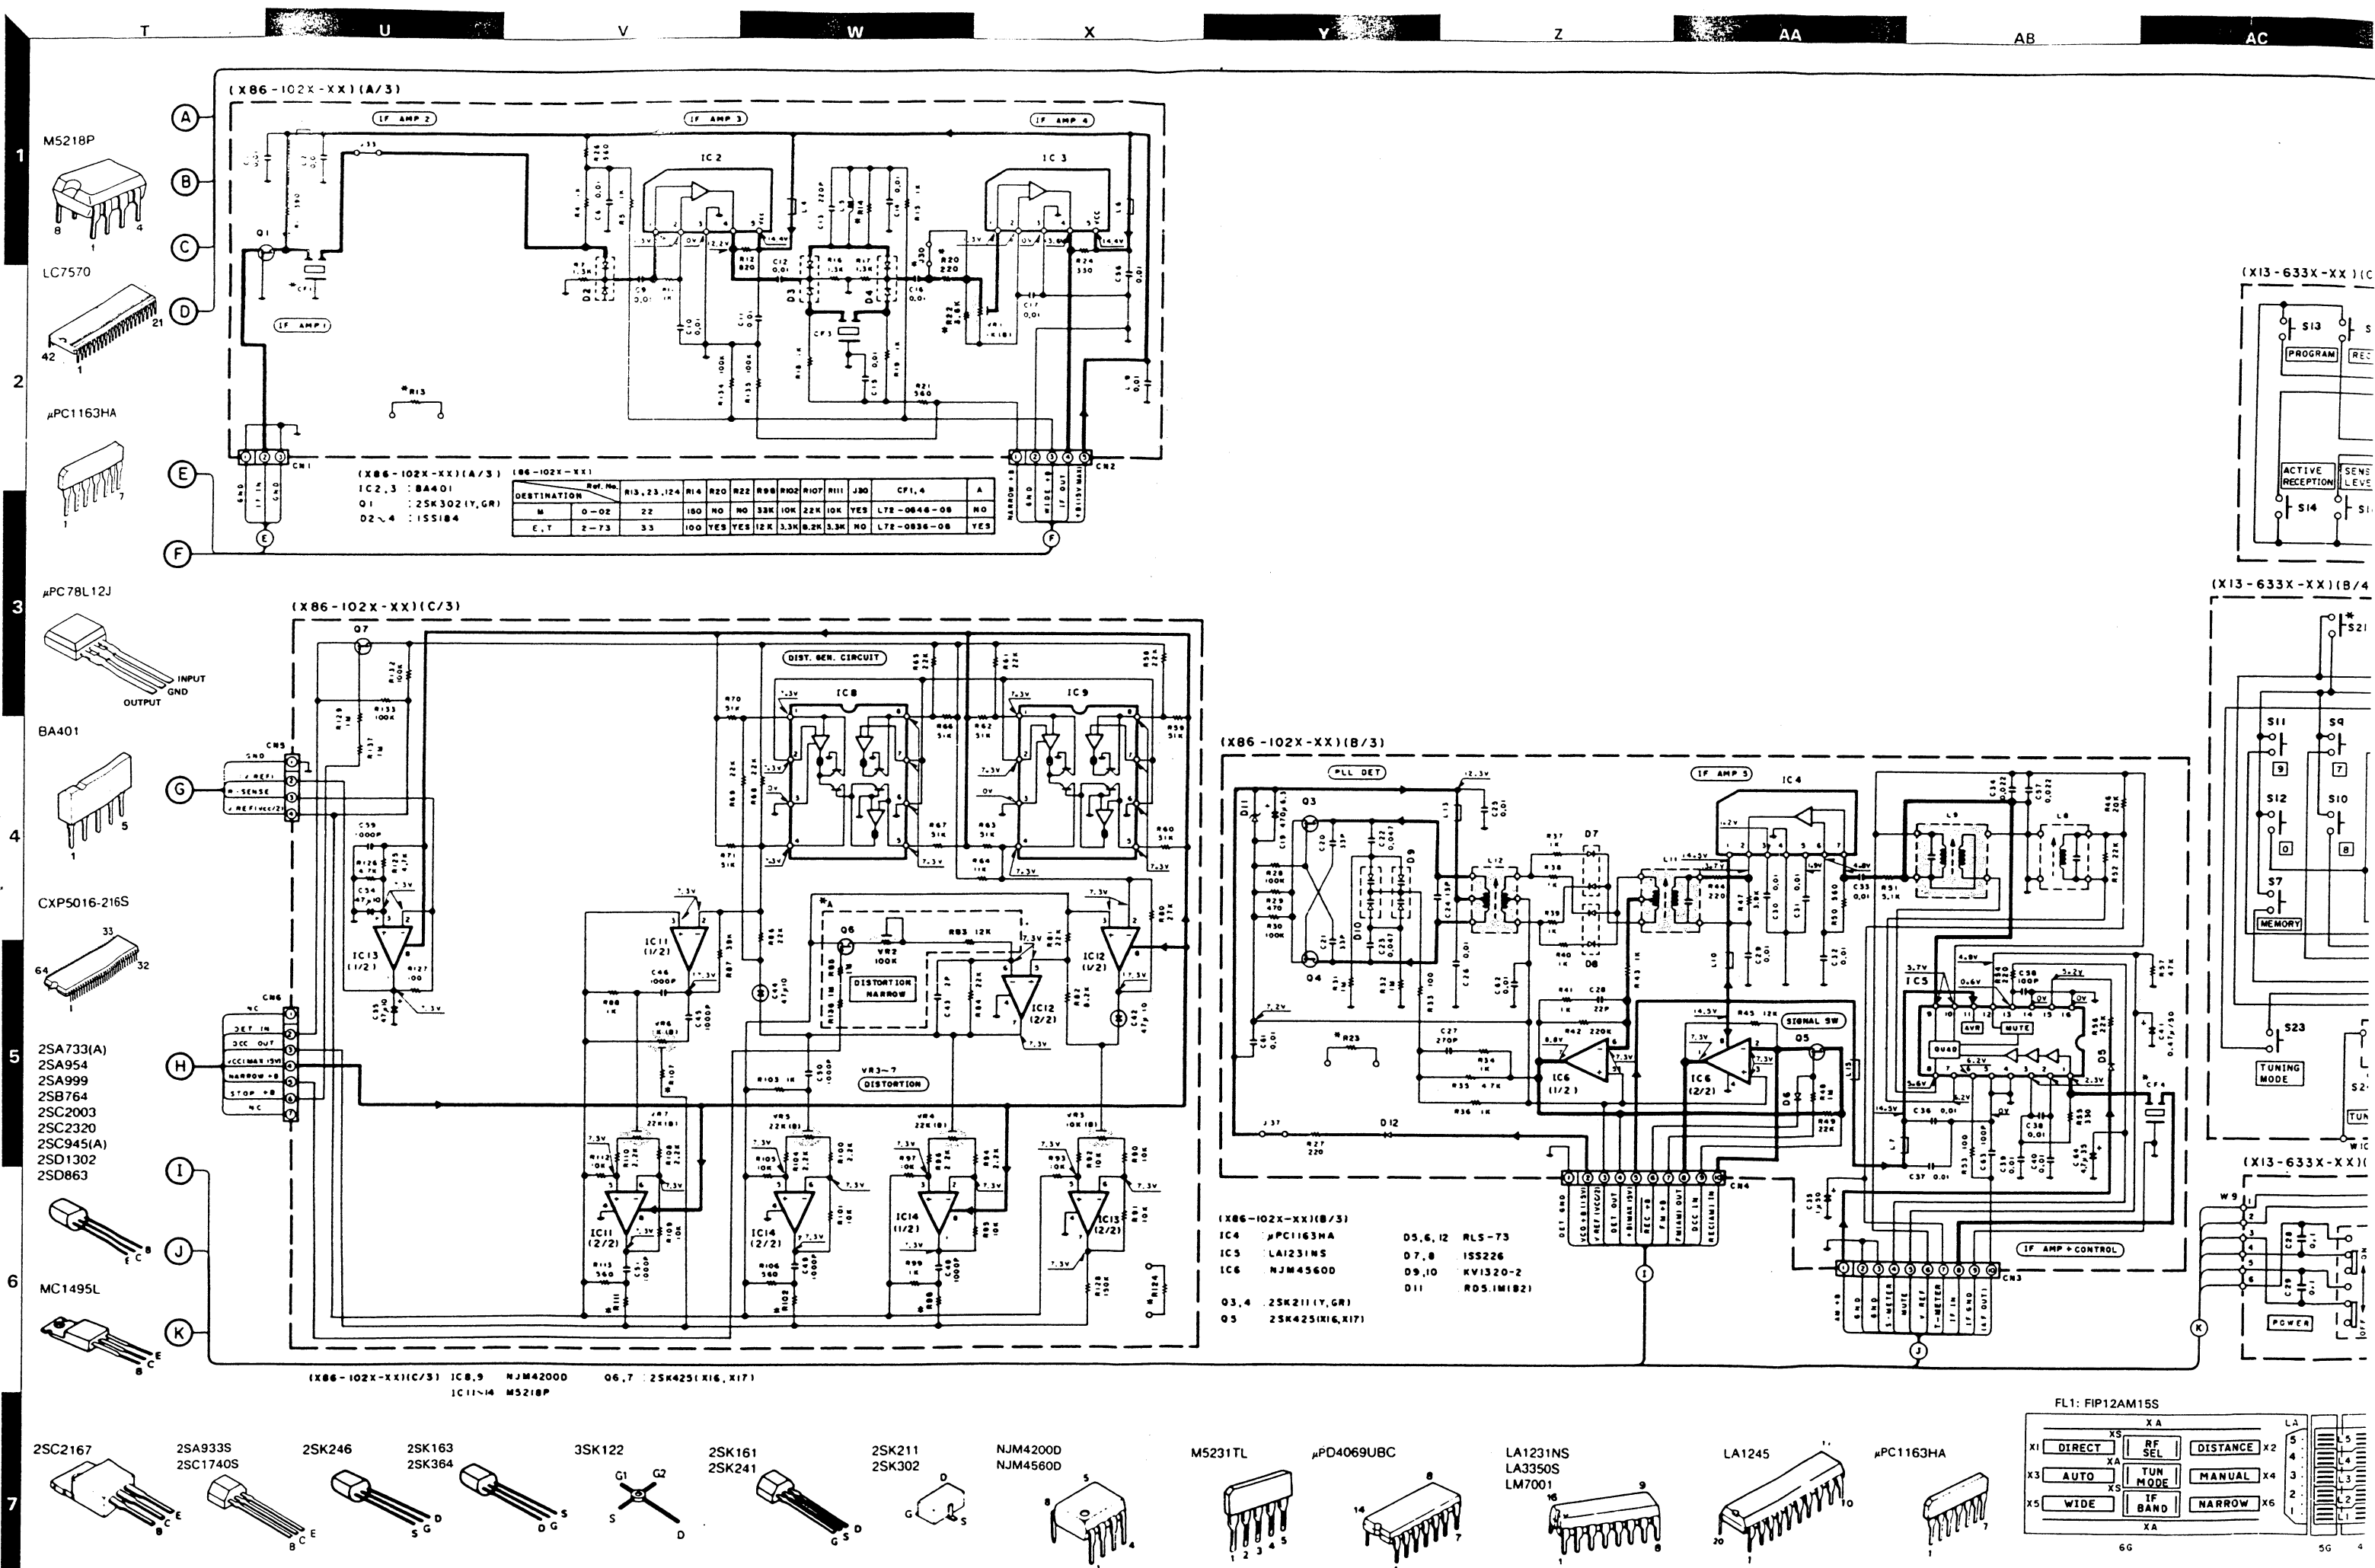

signal de programme FM (avec une force de signal de 60 dB à la borne ANT). Les valeurs peuvent différer légèrement du fait des variations inhérentes aux appareils et aux instruments de mesure individuels. Les valeurs entre parenthèses doivent être mesurées pendant la réception d'un signal de programme AM avec une force de signal de 60 dB à la borne ANT).

Die angegebenen Gleichspannungswerte wurden mit einem hochohmigen Spannungsmesser bei Empfang eines UKW-Signals (mit einer Feldstärke von 60 dB am

Antennenanschluß) gemessen. Dabei schwanken die Meßwerte aufgrund von Unterschieden zwischen einzelnen Instrumenten oder Geräten u.U. geringfügig. Die eingeklammerten Gleichspannungswerte wurden bei Empfang eines MW-Signals (mit einer Feldstärke von 60 dB am Antennenanschluß) gemessen.
